## Independent sets

An independent set is a set of vertices in a graph, no two of which are adjacent.

## Independent sets

An independent set is a set of vertices in a graph, no two of which are adjacent.

- Finding maximum independent sets is very hard

## Independent sets

An independent set is a set of vertices in a graph, no two of which are adjacent.

- Finding maximum independent sets is very hard
- Finding maximal independent sets is very easy

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.
- We approximate $\mathbb{E}\left[\iota\left(G_{n}\right)\right]=\mathbb{P}\left(\rho_{n} \in \mathbf{I}\left(G_{n}\right)\right)$ for $\rho_{n}$ chosen uniformly.

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.
- We approximate $\mathbb{E}\left[\iota\left(G_{n}\right)\right]=\mathbb{P}\left(\rho_{n} \in \mathbf{I}\left(G_{n}\right)\right)$ for $\rho_{n}$ chosen uniformly.
- We hope that this is determined by a small neighbourhood of $\rho_{n}$.

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.
- We approximate $\mathbb{E}\left[\iota\left(G_{n}\right)\right]=\mathbb{P}\left(\rho_{n} \in \mathbf{I}\left(G_{n}\right)\right)$ for $\rho_{n}$ chosen uniformly.
- We hope that this is determined by a small neighbourhood of $\rho_{n}$.
- Decay of correlation $\Longrightarrow \iota\left(G_{n}\right) \sim \mathbb{E}\left[\iota\left(G_{n}\right)\right]$ a.a.s.

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.
- We approximate $\mathbb{E}\left[\iota\left(G_{n}\right)\right]=\mathbb{P}\left(\rho_{n} \in \mathbf{I}\left(G_{n}\right)\right)$ for $\rho_{n}$ chosen uniformly.
- We hope that this is determined by a small neighbourhood of $\rho_{n}$.
- Decay of correlation $\Longrightarrow \iota\left(G_{n}\right) \sim \mathbb{E}\left[\iota\left(G_{n}\right)\right]$ a.a.s.
- This local view of $\rho_{n}$ is captured by the local limit of $G_{n}$.

## General framework

Let $G_{n}$ be a graph sequence satisfying $\left|G_{n}\right| \rightarrow \infty$.

- We wish to calculate the asymptotics of $\iota\left(G_{n}\right)$.
- We approximate $\mathbb{E}\left[\iota\left(G_{n}\right)\right]=\mathbb{P}\left(\rho_{n} \in \mathbf{I}\left(G_{n}\right)\right)$ for $\rho_{n}$ chosen uniformly.
- We hope that this is determined by a small neighbourhood of $\rho_{n}$.
- Decay of correlation $\Longrightarrow \iota\left(G_{n}\right) \sim \mathbb{E}\left[\iota\left(G_{n}\right)\right]$ a.a.s.
- This local view of $\rho_{n}$ is captured by the local limit of $G_{n}$.
- Develop a machinery to calculate the probability that the root of the local limit is red.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Local limits (a.k.a. Benjamini-Schramm Limits)

We say that a (random) graph sequence $G_{n}$ converges locally to a (random) rooted graph $(U, \rho)$ if for every $r \geq 0$ the ball $B_{G_{n}}\left(\rho_{n}, r\right)$ converges in distribution to $B_{U}(\rho, r)$, where $\rho_{n}$ is a uniform vertex of $G_{n}$.

## Examples

- $P_{n}, C_{n} \xrightarrow{\text { loc }} \mathbb{Z}$
- $[n]^{d} \xrightarrow{\text { loc }} \mathbb{Z}^{d}$
- $G(n, d / n) \xrightarrow{\text { loc }} \mathcal{T}_{d}$, a Galton-Watson Pois $(d)$ tree
- $G_{n, d} \xrightarrow{\text { loc }}$ the $d$-regular tree
- Uniform random tree $T_{n} \xrightarrow{\text { loc }} \hat{\mathcal{T}}_{1}$, a size-biased GW Pois(1) tree
- Finite $d$-ary balanced tree $\xrightarrow{\text { loc }}$ the canopy tree

## Convergence of the greedy independence ratio

Say that $G_{n}$ has subfactorial path growth if the expected number of paths from a typical vertex is subfactorial in their length.

## Convergence of the greedy independence ratio

Say that $G_{n}$ has subfactorial path growth if the expected number of paths from a typical vertex is subfactorial in their length.
(bounded degree $\subsetneq$ subfactorial path growth)

## Convergence of the greedy independence ratio

Say that $G_{n}$ has subfactorial path growth if the expected number of paths from a typical vertex is subfactorial in their length.
(bounded degree $\subsetneq$ subfactorial path growth)

Theorem (Krivelevich, Mészáros, M., Shikhelman '20)
Suppose $G_{n}$ has subfactorial path growth.
If $G_{n} \xrightarrow{\text { loc }}(U, \rho)$ then $\iota\left(G_{n}\right) \rightarrow \iota(U, \rho)$ a.a.s.

## Convergence of the greedy independence ratio

Say that $G_{n}$ has subfactorial path growth if the expected number of paths from a typical vertex is subfactorial in their length.
(bounded degree $\subsetneq$ subfactorial path growth)

Theorem (Krivelevich, Mészáros, M., Shikhelman '20)
Suppose $G_{n}$ has subfactorial path growth.
If $G_{n} \xrightarrow{\text { loc }}(U, \rho)$ then $\iota\left(G_{n}\right) \rightarrow \iota(U, \rho)$ a.a.s.

## Locally tree-like

We need to calculate $\iota(U, \rho)$, but even $\iota\left(\mathbb{Z}^{2}\right)$ is still unknown... Let us therefore restrict ourselves to locally tree-like graph sequences, i.e., graph sequences for which $(U, \rho)$ is almost surely a tree.

## Locally tree-like

We need to calculate $\iota(U, \rho)$, but even $\iota\left(\mathbb{Z}^{2}\right)$ is still unknown... Let us therefore restrict ourselves to locally tree-like graph sequences, i.e., graph sequences for which $(U, \rho)$ is almost surely a tree.

## Locally tree-like

We need to calculate $\iota(U, \rho)$, but even $\iota\left(\mathbb{Z}^{2}\right)$ is still unknown... Let us therefore restrict ourselves to locally tree-like graph sequences, i.e., graph sequences for which $(U, \rho)$ is almost surely a tree.

Assuming the children of $\rho$ are roots to independent subtrees, and conditioning on the label of $\rho$, children of the past are roots to independent processes.

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

$$
y(x)=\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x\right)
$$

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

$$
\begin{aligned}
y(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x\right) \\
& =x \cdot \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}<x\right) \\
& =\int_{0}^{x} \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=z\right) d z
\end{aligned}
$$

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

$$
\begin{aligned}
y(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x\right) \\
& =x \cdot \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}<x\right) \\
& =\int_{0}^{x} \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=z\right) d z \\
y^{\prime}(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=x\right)
\end{aligned}
$$

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

$$
\begin{aligned}
y(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x\right) \\
& =x \cdot \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}<x\right) \\
& =\int_{0}^{x} \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=z\right) d z \\
y^{\prime}(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=x\right)
\end{aligned}
$$

Thus, if $y$ is a unique solution of

$$
y^{\prime}(x)=\sum_{\ell \in \mathbb{N}} \mathbb{P}(\xi[<x]=\ell)\left(1-\frac{y(x)}{x}\right)^{\ell}, \quad y(0)=0
$$

then, $\iota(U, \rho)=y(1)$.

## Systems of ordinary differential equations

Let $(U, \rho)$ be a single-type branching process.

$$
\begin{aligned}
y(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x\right) \\
& =x \cdot \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}<x\right) \\
& =\int_{0}^{x} \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=z\right) d z \\
y^{\prime}(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=x\right)
\end{aligned}
$$

Thus, if $y$ is a unique solution of

$$
y^{\prime}(x)=\sum_{\ell \in \mathbb{N}} \mathbb{P}(\xi[<x]=\ell)\left(1-\frac{y(x)}{x}\right)^{\ell}, \quad y(0)=0
$$

then, $\iota(U, \rho)=y(1)$.

## Systems of ordinary differential equations

Let $(U, \rho)$ be a (simple) multitype branching process.

$$
\begin{aligned}
y_{k}(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \wedge \sigma_{\rho}<x \mid \tau=k\right) \\
& =x \cdot \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}<x, \tau=k\right) \\
& \left.=\int_{0}^{x} \mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=z, \tau=k\right) d z\right\rangle \\
y_{k}^{\prime}(x) & =\mathbb{P}\left(\rho \in \mathbf{I}\left(U\left[\mathcal{P}_{\rho}\right]\right) \mid \sigma_{\rho}=x, \tau=k\right)
\end{aligned}
$$

Thus, if $y$ is a unique solution of

$$
y_{k}^{\prime}(x)=\sum_{\ell \in \mathbb{N} \mathcal{T}} \prod_{j \in \mathcal{T}} \mathbb{P}\left(\xi^{k \rightarrow j}[<x]=\ell_{j}\right)\left(1-\frac{y_{j}(x)}{x}\right)^{\ell_{j}}, \quad y_{k}(0)=0
$$

then, $\iota(U, \rho)=\mathbb{E}\left[y_{k}(1)\right]$.

## Application: paths and cycles

$P_{n}$ and $C_{n}$ converge locally to $\mathbb{Z}$, which can be thought of as a 2-type branching process.

## Application: paths and cycles

$P_{n}$ and $C_{n}$ converge locally to $\mathbb{Z}$, which can be thought of as a 2-type branching process.

## Application: paths and cycles

$P_{n}$ and $C_{n}$ converge locally to $\mathbb{Z}$, which can be thought of as a 2-type branching process.

$$
\begin{array}{ll}
y_{b}^{\prime}(x)=1-y_{b}(x) & \Longrightarrow y_{b}(x)=1-e^{-x} \\
y_{r}^{\prime}(x)=\left(1-y_{b}(x)\right)^{2}=e^{-2 x} & \Longrightarrow y_{r}(x)=\frac{1}{2}\left(1-e^{-2 x}\right)
\end{array}
$$

## Application: paths and cycles

$P_{n}$ and $C_{n}$ converge locally to $\mathbb{Z}$, which can be thought of as a 2-type branching process.

$$
\begin{array}{ll}
y_{b}^{\prime}(x)=1-y_{b}(x) & \Longrightarrow y_{b}(x)=1-e^{-x}, \\
y_{r}^{\prime}(x)=\left(1-y_{b}(x)\right)^{2}=e^{-2 x} & \Longrightarrow y_{r}(x)=\frac{1}{2}\left(1-e^{-2 x}\right) .
\end{array}
$$

Thus

$$
\iota\left(P_{n}\right), \iota\left(C_{n}\right) \rightarrow \iota(\mathbb{Z})=y_{2}(1)=\frac{1}{2}\left(1-e^{-2}\right)
$$

## Application: paths and cycles

$P_{n}$ and $C_{n}$ converge locally to $\mathbb{Z}$, which can be thought of as a 2-type branching process.

$$
\begin{array}{ll}
y_{b}^{\prime}(x)=1-y_{b}(x) & \Longrightarrow y_{b}(x)=1-e^{-x}, \\
y_{r}^{\prime}(x)=\left(1-y_{b}(x)\right)^{2}=e^{-2 x} & \Longrightarrow y_{r}(x)=\frac{1}{2}\left(1-e^{-2 x}\right) .
\end{array}
$$

Thus

$$
\iota\left(P_{n}\right), \iota\left(C_{n}\right) \rightarrow \iota(\mathbb{Z})=y_{2}(1)=\frac{1}{2}\left(1-e^{-2}\right)
$$

$$
\alpha\left(P_{n}\right) / n, \alpha\left(C_{n}\right) / n \rightarrow 1 / 2 .
$$

## Application: binomial random graphs

Easy fact: $G(n, d / n)$ converges locally to the $\operatorname{Pois}(d)$ branching process.

$$
y^{\prime}(x)=\sum_{\ell=0}^{\infty} \frac{(d x)^{\ell}}{e^{d x} \ell!}\left(1-\frac{y(x)}{x}\right)^{\ell}=e^{-d y(x)}
$$

hence $y(x)=\log (1+d x) / d$.

## Application: binomial random graphs

Easy fact: $G(n, d / n)$ converges locally to the $\operatorname{Pois}(d)$ branching process.

$$
y^{\prime}(x)=\sum_{\ell=0}^{\infty} \frac{(d x)^{\ell}}{e^{d x} \ell!}\left(1-\frac{y(x)}{x}\right)^{\ell}=e^{-d y(x)}
$$

hence $y(x)=\log (1+d x) / d$. Thus

$$
\iota(G(n, d / n)) \rightarrow \iota\left(\mathcal{T}_{d}\right)=y(1)=\frac{\log (1+d)}{d}
$$

## Application: binomial random graphs

Easy fact: $G(n, d / n)$ converges locally to the $\operatorname{Pois}(d)$ branching process.

$$
y^{\prime}(x)=\sum_{\ell=0}^{\infty} \frac{(d x)^{\ell}}{e^{d x} \ell!}\left(1-\frac{y(x)}{x}\right)^{\ell}=e^{-d y(x)}
$$

hence $y(x)=\log (1+d x) / d$. Thus

$$
\iota(G(n, d / n)) \rightarrow \iota\left(\mathcal{T}_{d}\right)=y(1)=\frac{\log (1+d)}{d}
$$

$$
\alpha(G(n, d / n)) / n \rightarrow 2 \log d / d \cdot\left(1+o_{d}(1)\right) .
$$

## Size-biased Galton-Watson branching processes

## Application: uniform random trees

Let $s$ be the type of a vertex on the spine, and $t$ be the type of a vertex on one of the hanging trees. We have already seen

$$
y_{\mathrm{t}}(x)=\log (1+x),
$$

## Application: uniform random trees

Let $s$ be the type of a vertex on the spine, and $t$ be the type of a vertex on one of the hanging trees. We have already seen

$$
y_{\mathrm{t}}(x)=\log (1+x),
$$

and

$$
y_{\mathrm{s}}^{\prime}(x)=\left(1-y_{\mathrm{s}}(x)\right) y_{\mathrm{t}}^{\prime}(x)=\frac{1-y_{\mathrm{s}}(x)}{1+x}
$$

hence $y_{\mathrm{s}}(x)=1-(1+x)^{-1}$, and we get

$$
\iota\left(T_{n}\right) \rightarrow \iota\left(\hat{\mathcal{T}}_{1}\right)=y_{\mathrm{s}}(1)=\frac{1}{2}
$$

## Application: uniform random trees
